

Geeky World

Ross is a geek but he never admits it. He plays weird geeky games and enjoys them a lot. Recently he started playing a new game. He takes an array of "N" integers. Then he makes another array out of it which contains the sum of all the contiguous sub arrays of the original array. He sorts them in non-increasing order and keeps them in an array S that has 1-based index. Now he wants to find the elements at position K1, K2 and K3 in it.

For example, if the array has 3 elements {10, 20, 30}, then the formed array will have 6 elements as $S[1..6] = \{60, 50, 30, 30, 20, 10\}$.

Input

First line of the input will contain 4 integers "N", "K1", "K2" and "K3". The next line will contain "N" integers $A[0], A[1] \dots A[N-1]$.

Output

Output three integers, the elements at position K1, K2 and K3 in the formed array separated by a single space.

Constraints

$$2 \leq N \leq 10^4$$

$$1 \leq K1 \leq K2 \leq K3 \leq 2000$$

$$K3 \leq N*(N+1)/2$$

$$-10^4 \leq A[i] \leq 10^4$$

Example

Input:

```
3 1 3 6
10 20 30
```

Output:

```
60 30 10
```

Input:

```
4 2 6 10
20 -15 10 -15
```

Output:

```
15 -5 -20
```
