

# Cut Stick

Ann meets another problem.

Since she has a  $n$ -meter-long stick, she wants to cut it into small ones. Of course she would not let the small sticks be shorter than 1 meter. At the same time she is so mean that she can't stand that any three of the small sticks could make a triangle. That is to say, any 3 of the small sticks can not form a triangle if there are 3 or more small sticks.

You can assume that the small sticks only have integer length.

## Input

A line contains a positive integer  $n$ , which is the length of the long stick. It does not exceed  $10^5$ .

## Output

Print a number -- the maximum number of small sticks Ann could get.

## Example

**Input:**

1  
2  
3  
4

**Output:**

1  
2  
2  
3
