

Farmers Cattle

Farmer John owns a single cow and he loves it a lot. The cow has a disease and is going to die. To survive, the cow needs medicine of a particular type each day. Let us say the cow needs **medicine**[*i*] to survive the *i*th day. (**medicine**[*i*] will be terminated by -1, which is an unavailable medicine, and the cow has to invariably die that day).

To help the cow, John has decided to buy pastures of some medical value. Farmer sees a two-dimensional grid of pastures, each cell having exactly one medical herb. Now he needs to buy a sub-rectangular region of the grid, whose area cannot exceed **A** (**A** > 1). With this region the farmer intends to feed his cow, as long as possible.

Input Format:

The input file consists of multiple testcases.

The first line of each testcase contains three integers, **R**, **C** and **A**.

The second line consists of sequence of integers describing **medicine**[*i*]. This list will be terminated by -1.

The next **R** lines contain **C** integers each, specifying the medicinal type of the herb in that cell. ($1 \leq R, C \leq 200$). All herbs are specified by non negative integers.

Input terminates with a line containing three zeros and must not be processed.

Output Format:

For each testcase print a single line containing 5 integers:

days r1 c1 r2 c2

($1 \leq r1 \leq r2 \leq R, 1 \leq c1 \leq c2 \leq C$)

- **days** is the number of days the cow survives. We wish to maximise this.
- If there are more than one solutions print the one with minimal *r1*.
- If there are more than one solutions still, print the one with minimal *c1*.
- If there are more than one solutions still, print the one with minimal *r2*.
- If there are more than one solutions still, print the one with minimal *c2*.

Sample Input:

```
3 4 6
12 30 12 100 22 -1
30 12 5 3
12 30 100 5
22 3 22 100
3 4 6
2 30 12 100 22 -1
30 12 5 3
12 30 100 5
22 3 22 100
3 4 6
12 30 12 100 22 -1
30 12 5 3
12 30 100 5
22 12 22 100
```

0 0 0

Sample Output:

4 1 1 2 3

0 1 1 1 1

5 1 2 3 3
