

Text Generator

LoadingTime has been given a task these days. He is required to write a tool called Text Generator. This software is widely used among the kids who are under seven. It generates an article with the size of a given number L for users. If an article contains at least one word which the users know, we consider it readable. Now, LoadingTime wants to know, how many readable articles can it generate, and he can improve his Text Generator. Could you help him??

Input

The input contains multiple test cases.

The first line of each test case contains two integers N ($1 \leq N \leq 10$), L ($1 \leq L \leq 1000000$). The following N lines contain N words representing the words known by the users. All the words and the generated article only contain uppercase letters, and the length of each word is not greater than 6.

Output

For each test case, your program should output an integer as LoadingTime required. As the number could be quite large, you only need to print the answer modulo 10007.

Example

Input:

```
2 2
A
B
2 10000
ABC
B
```

Output:

```
100
5960
```
