

Dispatching

Dispatching

In a sect of ninja, ninjas are dispatched to a client, and they are rewarded according to their work.

In this sect, there is one ninja called the Master. Every ninja except the Master has one and only one boss.

In order to preserve the confidentiality and to encourage leadership, any instructions concerning their work are

always sent by a boss to his/her subordinates. It is forbidden to send instructions by other methods.

You are gathering a number of ninjas and dispatch them to a client. You have to pay salaries to dispatched

ninjas. For each ninja, the amount of salary for him/her is fixed. The total amount of salaries paid to them should

be within a budget. Moreover, in order to send instructions, you have to choose a ninja as a manager who can send

instructions to all dispatched ninjas. When instructions are sent, a ninja who is not dispatched may mediate the

transmission. The manager may or may not be dispatched. If the manager is not dispatched, he will not be paid.

You would like to maximize the satisfaction level of the client as much as possible within a budget. The sat-

isfaction level of the client is calculated as the product of the total number of dispatched ninjas and the leadership

level of the manager. For each ninja, his/her leadership level is fixed.

Task

Write a program that, given the boss B_i , the amount of salary C_i , the leadership level L_i of each ninja i ($1 \leq i \leq N$),

and the budget for salaries M , outputs the maximum value of the satisfaction level of the client when the manager

and dispatched ninjas are chosen so that all the conditions are fulfilled.

Constraints

$1 \leq N \leq 100\,000$ The number of ninjas

$1 \leq M \leq 1\,000\,000\,000$ The budget for salaries

$0 \leq B_i < i$ The boss of each ninja

$1 \leq C_i \leq M$ The amount of salary of each ninja

$1 \leq L_i \leq 1\,000\,000\,000$ The leadership level of each ninja

Input

Read the following data from the standard input.

- The first line of input contains two space separated integers N , M , where N is the number of ninjas and M

is the budget.

- The following N lines describe the boss, salary, leadership level of each ninja. The $(i + 1)$ -th line contains

three space separated integers B_i, C_i, L_i , describing that the boss of ninja i is ninja B_i , the amount of his/her

salary is C_i , and his/her leadership level is L_i . The ninja i is the Master if $B_i = 0$. Since the inequality

$B_i < i$ is always satisfied, for each ninja, the number of his/her boss is always smaller than the number of

himself/herself.

Output

Write the maximum value of the satisfaction level of the client to the standard output.

Grading

In test cases worth 30% of the full score, $N \leq 3\,000$.

Sample Input and Output

Sample Input 1

5 4

0 3 3

1 3 5

2 2 2

1 2 4

2 3 1

Sample Output 1

6

If we choose ninja 1 as a manager and ninja 3, 4 as dispatched ninjas, the total amount of salaries is 4 which

does not exceed the budget 4. Since the number of dispatched ninjas is 2 and the leadership level of the manager

is 3, the satisfaction level of the client is 6. This is the maximum value.
