

Super Primes

In mathematics, a prime number (or a prime) is a natural number which has exactly two distinct natural number divisors: 1 and itself.

Super-prime numbers are the elements of the subsequence of prime-numbers that occupy prime-numbered positions within the sequence of all prime numbers. That is, if $p(i)$ denotes the i th prime number, the numbers in this sequence are those of the form $p(p(i))$ or Primes with a prime index in the sequence of prime numbers (the 2nd, 3rd, 5th, ... prime).

Your task is to generate all super primes $< 10^7$.

Input:

There is NO input for this problem.

Output:

Print all super-primes $< 10^7$ in ascending order, one per line.

First few lines of Output

```
